amir STUDIO ™
CREATIVE AGENCY

BRAND & INTERFACE SYSTEM
Version 1.0

The amirSTUDIO System.

Colour, type, shape and motion — the decisions behind the site, written down so they can be repeated on purpose.

OCTOBER 2026 · TWELVE PAGES

STUDIO INTERNAL / CLIENT SHAREABLE

00 — CONTENTS

What’s inside.

A working manual, not a mood board. Every value here exists in the site today; every rule here is a rule the site already follows.

01 **Foundation** 03

02 **Colour** 04

03 **The chameleon rule** 05

04 **Typography** 06

05 **Layout & rhythm** 07

06 **Shape & elevation** 08

07 **Components** 09

08 **Motion** 10

09 **Chrome & navigation** 11

10 **Tokens & access** 12

How to use this document

Designers: copy the token block on page 12 before you draw anything. Developers: the CSS variables and the `inkFor()` helper are the source of truth — if a new component disagrees with them, the component is wrong.

What this replaces

DESIGN.md is the external reference study (the “bento” language). This book is the studio's own resolution of it: the values we actually shipped, the pieces we changed, and the rules we hold ourselves to.

5 SECTIONS

12 COLOURS

2 TYPEFACES

0 DROP SHADOWS

01 — FOUNDATION

Confident. Playful. Precise.

The studio makes premium work for small teams. The system has to feel expensive without feeling cold — so it pairs editorial restraint with pop-art nerve.

A

Confident

One idea per screen. Huge type, short lines, no hedging. If a sentence needs a second clause to survive, it gets cut.

B

Playful

Colour does the entertaining. Full-bleed bands, sticker outlines, a music button that wears whatever colour the page is wearing.

C

Precise

Nothing decorative for the sake of it. Every card is a grid cell, every animation is a beat, every colour is a role.

Voice

First person, present tense, declarative. The studio speaks as “I” in headlines and “we” in service copy. Sentence case. Full stops. No exclamation marks — the colour already shouted.

> **Design that earns its place.**
>
> **Nothing decorative for the sake of it.**

Personality in one line

A studio that treats a website like a physical object: printed, cut out, and stuck down with real ink outlines.

Never

- Gradients, glows, or soft shadows
- Grey-on-grey “premium” minimalism
- Stock photography of laptops
- More than one loud accent per screen

02 — COLOUR

One loud accent. Five full bands.

Each section owns one colour and fills the entire viewport with it. Ink is the only structural colour; lime is the only action colour.

Paper
#F5F5F3
Page base · Home section

Ink
#000000
Type, strokes, focus

Lime
#D2E823
Primary action only

Lavender
#E9C0E9
About band

Maroon
#780016
Works band

Cobalt
#2665D6
3D scene band

Leaf
#EBFFC5
Contact band

White
#FFFFFF
Card surfaces

Support colours

Sage #676B5F · Forest #254F1A · Mustard #D6A337 · Midnight #1E2330

Sage carries secondary copy; the others are card and accent fills only. None of them is ever an action colour.

Rules

- Lime never fills chrome, navigation, or decoration — CTA and focus ring only.
- No two bands of the same colour are ever adjacent.
- Strokes are pure ink. Muted text uses opacity, not grey.
- No gradients. A band is one flat colour, edge to edge.

03 — THE CHAMELEON RULE

Colour follows the scroll.

The interface is never a fixed colour. Every band publishes the colour it is wearing, and the fixed chrome — music button, menu button, menu row — reads it and repaints.

01 · Home	#F5F5F3	INK #000	19.2 : 1
02 · About	#E9C0E9	INK #000	13.2 : 1
03 · Our Works	#780016	INK #FFF	11.6 : 1
04 · 3D Scene	#2665D6	INK #FFF	5.4 : 1
05 · Work With Us	#EBFFC5	INK #000	19.6 : 1

The mechanism

Each band declares `data-bg`. On entry the deck writes it to two custom properties and every fixed element inherits them:

```
--chrome-bg : the band colour
--chrome-fg : black or white, by luminance

.music, .burger {
  background: var(--chrome-bg);
  color:      var(--chrome-fg);
}
```

The threshold

Ink flips at relative luminance `0.45`. White above, black below — the same maths as WCAG, tuned so cobalt lands on white type.

Watch mustard. At L=0.408 it is five points under the line, so the formula returns white at 2.3:1. Mustard is a fill, never a chrome surface — if it ever becomes one, force black ink (9.2:1).

Never hardcode

Chrome never names a colour. It asks the band. Adding a sixth band requires no CSS for the chrome at all.

Never invert alone

When a control is “on”, it swaps the pair — fill becomes ink, ink becomes fill. It never introduces a third colour.

Always test both

Every chrome state is reviewed on all five bands before it ships. A control that only works on Paper is not finished.

04 — TYPOGRAPHY

Two voices. Tight tracking.

Space Grotesk speaks; Inter explains. Headlines are set as shapes, not sentences, and tracking goes negative as the size goes up.

I Design Digital Experiences.

Space Grotesk 700 · 144px max · −0.04em · line-height 0.90

Space Grotesk — display

Headlines, section titles, card titles, prices, menu rows. Weights 700 and 800 only. Negative tracking from −0.02em at 16px to −0.045em at 62pt.

Inter — interface

Body, labels, buttons, footnotes, metadata. Weights 400, 600, 700. Tracking relaxes to +0.2em on uppercase micro-labels.

ROLE	FACE	WEIGHT	SIZE	TRACKING	LEADING
Hero	Space Grotesk	900	`clamp(2rem, min(8vw,14vh), 9rem)`	`-0.04em`	0.90
Display	Space Grotesk	800	`clamp(2rem, min(5.4vw,8.6vh), 5rem)`	`-0.043em`	1.00
Card title	Space Grotesk	700	`clamp(19px, min(1.7vw,2.6vh), 24px)`	`-0.024em`	1.20
Lead	Inter	400	`clamp(.95rem, min(1.15vw,1.8vh), 1.125rem)`	`-0.02em`	1.55
Body	Inter	400	`clamp(.95rem, min(1.5vw,2.2vh), 1.5rem)`	`-0.01em`	1.60
Primary button	Inter	700	`32px`	`-0.01em`	1.00
Label / meta	Inter	600	`12px`	`+0.20em`	1.00

Optical notes

Tight tracking only works above 20px. Below that, −0.01em is the floor — anything tighter starts to collide.

Hierarchy

Exactly three weights per screen: display 700/800, body 400, label 600. Emphasis comes from scale and colour, not from bolding.

05 — LAYOUT & RHYTHM

One section. One screen.

The site is a deck, not a page. Each band is exactly one viewport tall and snaps; there is no in-between state where two sections share the screen.

Deck

A single scroll container with `scroll-snap-type: y mandatory` and `scroll-snap-stop: always`. Sections are `100dvh`, so mobile chrome can never crop the composition.

Gutters

5vw on every side, every breakpoint. Content is capped at 1200px and centred, so the same composition survives a 13-inch laptop and a 6-inch phone.

Vertical padding

88 / 64 at rest, stepping down to 44 / 18 on very short viewports. The label sits at 4.75rem from the top, the number mirrors it on the right.

Fit guard

If a band's content is taller than its padded height, the inner block scales down — never below 0.7 — rather than clipping. Content is always fully readable.

Spacing scale

TOKEN	VALUE	USE
`xs`	`4px`	Tag internals
`sm`	`8px`	Icon gaps
`md`	`12px`	Button rows
`lg`	`16px`	Grid gutters
`xl`	`24–32px`	Card padding
`2xl`	`56–64px`	Section beats

Breakpoints

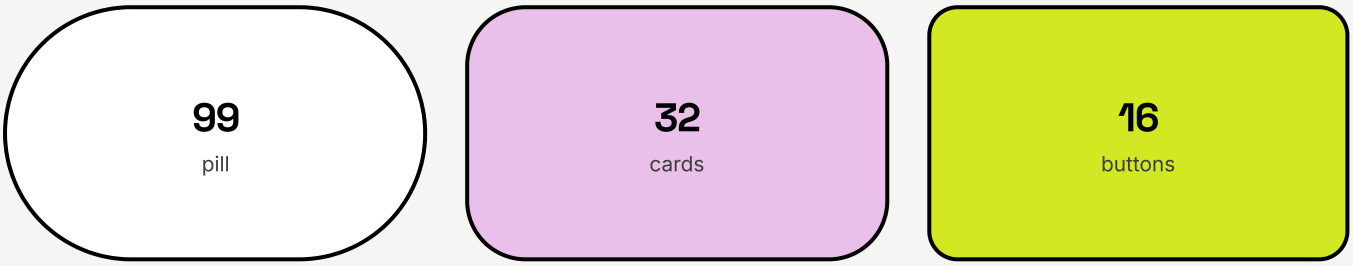

QUERY	WHAT CHANGES
`≤ 900px`	Single column; cards 32→24px; buttons 16→14px
`≤ 640px`	Work rows become horizontal strips
`≤ 560px`	Tiles stack; type steps down
`≤ 360px`	Tightest CTA and footer spacing
`h ≤ 760/620/520`	Vertical padding and chrome shrink in three steps

Rule of the deck: if a component only exists to fill space between sections, it doesn't exist. Sections touch. Colour does the dividing.

06 — SHAPE & ELEVATION

The border is the elevation.

There are no shadows in this system. A 2px ink outline does all the lifting — it is what makes every surface read as a sticker rather than a pane of glass.

Radius set

SURFACE	RADIUS
Chrome / pills / tags	99px
Cards, tiles, works, CTA card	32px
Same, ≤900px	24px
Compact work rows	20px
Buttons, menu rows	16px
Same, ≤900px	14px

Outline

`--stroke: 2px solid #000`, applied on every card, tile, button and pill. On the darkest bands the stroke stays black — the fill provides the contrast, never a white outline.

No exceptions

No blur behind cards, no inner shadow, no glassmorphism. The only blur in the system is the fixed menu frost, and that is a documented state (page 11).

DO

- \+ Give every new surface the same 2px ink stroke
- \+ Let colour contrast carry hierarchy inside a card
- \+ Keep radius proportional to area — bigger surface, bigger curve

DON'T

- – Add `box-shadow` to imply depth
- – Use 1px hairlines for structure
- – Round a button to 32px to match a card

07 — COMPONENTS

Buttons, cards, and their jobs.

Two buttons, four surfaces, one icon language. Nothing gets a new component until it can be described as one of these.

PRIMARY — START A PROJECT

Start a project

Lime fill, ink type, 16px radius, 2px stroke. Deliberately larger than everything beside it: 32px type, padding `clamp(26px,4.4vh,36px) 56px`. Hover lifts 2px, active drops 2px.

SECONDARY — SEE THE WORK

See the work

Transparent fill, ink type and stroke, same 16px radius. Sits on the same baseline as the primary — the row is `align-items:flex-end`, so a size difference never breaks the line.

TILE · STAT

8+

Years of practice

WORK CARD

Field Notes

Editorial platform

SCENE CARD

◆

WebGL scene

COMPONENT	FILL	STROKE	RADIUS	PADDING
Primary button	Lime	2px ink	16px	26–36 / 56
Secondary button	None	2px ink	16px	13–18 / 28
Card / tile	White or band	2px ink	32px	16–24
Work card	Brand fill	2px ink	32px	18–24
Chrome pill	Chameleon	2px current	99px	0 · 42px box
Menu row	Chameleon when active	2px ink	16px	16 / 18

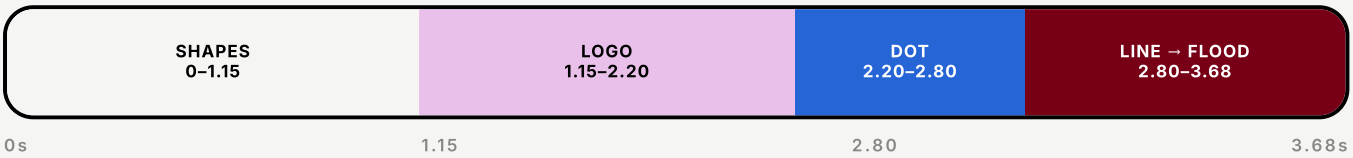

Interaction: every button lifts 2px on hover and settles 2px on press. No colour change on the primary — the lime is already the loudest thing on screen. Secondary darkens to `rgba(0,0,0,.08)`.

08 — MOTION

Motion is a beat structure.

Nothing moves decoratively. Every animation either explains where content came from or confirms that an input landed.

The intro — 3.68s, once per session

Five clip-path shapes swap every 287.5ms, each rotating 20° as it lands: circle → triangle → hexagon → square → plus. The lockup compresses to an 11px dot, the dot stretches into a full-height line, and the line widens to flood the viewport in the band's own colour. The overlay is lifted on the same frame the flood completes — because the flood is the section colour, there is no flash and no second curtain.

Section reveal

The first time a band enters view, its blocks rise 26px and fade in: 0.8s, `power3.out`, 75ms stagger. Once per section per page load — returning to a section never replays it.

The hero is excluded from the observer and is cued by the intro's handover, so it rises exactly as the page is revealed.

Deck colour

The page background cross-fades over 500ms while the band scrolls in. Scroll snapping itself is instant — the deck never animates a landing.

Feedback

The music toggle pops its icon 1 → 1.3 → 0.92 → 1 over 440ms on `cubic-bezier(.34,1.56,.64,1)`. The burger uses the same spring over 520ms. Both are confirmations, not decoration.

Durations

TOKEN	VALUE	USE
`micro`	`200ms`	Hover, press
`ui`	`280–450ms`	Pop, menu rows
`band`	`500ms`	Background colour
`reveal`	`800ms`	Section entrance

Two curves

```
--ease: cubic-bezier(.25,.1,.25,1)
--spring: cubic-bezier(.34,1.56,.64,1)
```

Transform only

Animate transform and opacity. Never animate layout properties — the deck's snap maths depends on stable geometry.

Reduced motion

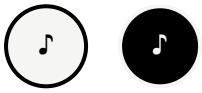

Every reveal, pop and transition is disabled under `prefers-reduced-motion`. Content is visible from the first frame.

09 — CHROME & NAVIGATION

The furniture wears the room.

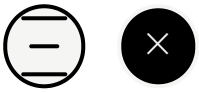

Three fixed elements sit above the deck: the logo, the music toggle, and the menu. All of them are monochrome, all of them borrow the current band.

MUSIC TOGGLE

Off = band fill with contrast ink. On = the pair inverted. The glyph is a hand-drawn two-note mark at 2px; a diagonal slash fades out when playing. 42px, dropping to 38 / 34 / 30 on short viewports.

MENU BUTTON

Three rounded strokes, the middle one short — that asymmetry is the “cute”. On open they fold into a cross, the button inverts, and it pops on the spring curve every tap.

Section menu

Mobile only (≤900px). It opens over a 50% paper frost with an 18px backdrop blur — everything behind it reads as blurred out, but the colour still shows through. Rows enter in a 55ms stagger.

Each row is a real anchor, so the deck's own snap and paint logic runs. The row for the current band is filled with that band's colour and its contrast ink; every other row stays black.

Logo

Space Grotesk 700: “amir” at 0.6rem, “STUDIO” at 1.2rem, ™ at 0.6rem, with a 0.5rem tracked tagline under it. Set in white over `mix-blend-mode: difference`, so it is legible on every band without repainting.

Clearance

Fixed chrome owns a lane. If a band's copy would slide under the music button, that band's top padding is nudged — never the button's position.

Opening and closing: the frost fades over 440ms while rows rise; closing reverses with no stagger, so dismissal is always faster than arrival. Escape closes it, and the menu owns the arrow keys while open.

10 — TOKENS & ACCESS

The source of truth.

CSS variables

```
:root{
  /* surfaces */
  --c1:#F5F5F3; --white:#ffffff;
  --ink:#000000; --sage:#676b5f;

  /* bands */
  --lavender:#e9c0e9; --cobalt:#2665d6;
  --maroon:#780016;   --leaf:#ebffc5;

  /* accents */
  --lime:#d2e823;  --forest:#254f1a;
  --mustard:#d6a337; --midnight:#1e2330;

  /* shape */
  --stroke:2px solid #000;
  --r-pill:99px; --r-card:32px; --r-btn:16px;

  /* motion */
  --ease:cubic-bezier(.25,.1,.25,1);
  --spring:cubic-bezier(.34,1.56,.64,1);

  /* live chrome */
  --chrome-bg:#f5f5f3;
  --chrome-fg:#000000;
}
```

Ink resolver

```
const lin = c => {
  c = parseInt(c, 16) / 255;
  return c <= 0.04045 ? c / 12.92
                      : Math.pow((c + .055) / 1.055,
2.4);
};

const L = hex =>
  .2126 * lin(hex.slice(1,3)) +
  .7152 * lin(hex.slice(3,5)) +
  .0722 * lin(hex.slice(5,7));

const ink = hex =>
  L(hex) > 0.45 ? '#000000' : '#ffffff';
```

Band contract

```
<section data-bg="#2665d6">
```

Paint reads `data-bg`, writes `--chrome-bg` / `--chrome-fg`, and emits `amir:section` with the id. Chrome and menu only listen.

Accessibility floor

- Focus is 3px, offset 4px: lime in the deck, band ink on chrome.
- Every band clears 4.5:1 for body text with its resolved ink.
- Reduced motion removes every entrance, pop and colour transition.
- Menu is a real `nav` with `aria-expanded`, `aria-controls` and a current-row marker.
- Tap targets stay ≥ 42px, with an invisible 9px halo around chrome.
- The music toggle is `aria-pressed` and never autoplays.

Pre-flight

- [ ] Is every surface stroked at 2px?
- [ ] Is there exactly one lime object on screen?
- [ ] Does the chrome read on all five bands?
- [ ] Does anything clip below 0.7 scale?
- [ ] Do the buttons share a baseline?
- [ ] Does it still work with motion turned off?

If it needs a shadow to work, it isn't finished.
